

Cross Every Bridge Once, Then Teach a Computer to Do It

Do this before the lecture, in pencil. Nothing here needs a word you have not been given on the sheet.

Part 1 — Seven bridges

Seven footbridges, *a* to *g*, join four pieces of land: the north bank **N**, the south bank **S**, and two islands **W** and **E**. Cross every bridge exactly once.

Question 1(a): Find such a route. Start and finish anywhere. Land may repeat; bridges may not. Two steps are done for you.

N *a* W *b* N _____

Question 1(b): Draw an eighth bridge *h* on the map, between **W** and **E**, below *g*. Try again. Which bridge is left over?

Question 2: One piece of land, on its own. Arriving uses up one bridge, leaving uses up another — so bridges get used in **pairs**.

Join two bridge-ends with a curved line to mean “in here, out there”. Pair up as far as you can. The first is done.

2 bridges

3 bridges

4 bridges

5 bridges

	2 bridges	3 bridges	4 bridges	5 bridges
pairs you drew	1			
bridges left over	0			

(a) Which ones can you walk straight *through*? _____

(b) What do those numbers share? _____

(c) A left-over bridge has no partner, so this land must be the tour's _____

Question 3: Count the bridges on the map. Map A, N is done.

	N	W	S	E	how many have a left-over?
Map A (7 bridges)	3				
Map B (8 bridges)					

One start, one finish. So at most _____ pieces of land may have a left-over bridge.

Map A: _____

Map B: _____

No route on Map B because _____

Question 4: Königsberg, 1736. Four pieces of land, seven bridges. Two pairs join the same land; both of a pair must be crossed.

Bridges: A ____ B ____ C ____ D ____

Is the walk possible? _____

Destroying one bridge is enough. Which ones work? _____

Part 2 — Three kinds of route

A different network: five bus stops.

Question 5(a): Fill in the table. First row done.

route	repeats a line?	repeats a stop?	name
A B D B C	yes (B–D twice)	yes (B)	
A B D C B			
A B C D E			

Question 5(b): Write the right name in the last column.

Repeats nothing: **path**. Never repeats a line: **trail**. Repeats both: **walk**.

Question 5(c): A route from A to E that repeats a stop but no line:

A _____ E

Question 5(d): Your route in 1(a) is a _____.

Question 5(e): It cannot be a path: 7 lines need _____ different pieces of land, and the map has _____.

Part 3 — Predictions for the lab

Fill this in on paper first, then check it in the lab. A new network:

Question 6(a): Write **1** in row i , column j if a line joins i and j , else **0**. Row 1 done.

$$A = \begin{array}{c|cccc} & 1 & 2 & 3 & 4 \\ \hline 1 & 0 & 1 & 0 & 0 \\ 2 & & & & \\ 3 & & & & \\ 4 & & & & \end{array}$$

Question 6(b): Add up each row, then compare with the picture.

row totals: _____

Each row total is the _____

of that node.

Question 6(c): A **2-step route** is one line, then one more. Count them on the picture.

1 to 3: how many? _____ list them: $1 \rightarrow _____ \rightarrow 3$

1 to 2: how many? _____ why? _____

2 back to 2: how many? _____

Question 6(d): The lab will square your grid. What do you expect in A^2 ?

row 1, column 3: _____ row 1, column 2: _____

the diagonal: _____

Now the lab, in pairs. Bring this sheet. One laptop, two people: the one not typing says the answer before the other one runs the cell.
